#### Abstract

A series of benzimidazolium salts bearing a para-halogenophenyl end group in position 3 was subject to complexation with $a$ - and b-cyclodextrins. Two out of the three studied compounds were leading to inclusion complexes with both cyclodextrins. For both cyclodextrins the strength of interaction with bezimidazolium ions increases in the order $\mathrm{F}<\mathrm{Cl}<\mathrm{Br}$.

Keywords: benzimidazolium salts, benzimidazolines, cyclodextrins, inclusion complexes, NMR

1-Benzyl-3-[2-(aryl)-2-oxoethyl]-5,6-dimethylbenzimidazolium salts and ylides have been extensively used by us as intermediates in the synthesis of various benzymidazole fused rings or other heterocycles resulting from the imidazole ring opening [1-6]. These syntheses are part of our wider interest in the study of chemistry and properties of various nitrogen containing heterocycles [7-18]. There is a wide interest in studying cyclodextrin inclusion complexes of a range compounds with various aims including changing the solubility, drug/ compound delivery carriers, structural or theoretical studies, etc. [19-22], including of course compounds with benzimidazole moieties [23-26]. To our knowledge there is no study up to date involving cyclodextrin complexes with 1-benzyl-3-[2-(aryl)-2-oxoethyl]-benzimidazolium salts. The solubility in water of 1-benzyl-3-[2-(aryl)-2-oxoethyl]-5,6-dimethyl-benzimidazolium salts is quite low and the possible complexation with cyclodextrins would possibly change significantly this physical property. Moreover, it would be interesting to asses which moieties, i.e. 1-benzyl, 3 -aryloxoethyl, or 5,6-benzo-fused ring are the preferred complexation sites of these compounds.

In this study we report on the synthesis of 1-benzyl-3-[2-(4-fluorophenyl)-2-oxoethyl]-5,6-dimethylbenzimidazolium bromide (1a), 1-benzyl-3-[2-(4-chlorophenyl)-2-oxoethyl]-5,6-dimethylbenzimidazolium bromide (1b) and 1-benzyl-3-[2-(4-bromophenyl)-2-oxoethyl]-5,6-dimethylbenzimidazolium bromide (1c) and on their complexation with a-cyclodextrin ( $\boldsymbol{\alpha} \mathbf{C D}$ ) and b-cyclodextrins ( $\boldsymbol{\beta C D}$ ).

## Experimental part

Melting points were determined on a Boetius apparatus and are uncorrected. The IR spectra were recorded on a Nicolet Impact 410 spectrometer, in KBr pellets. The NMR spectra have been recorded on Bruker Avance III 400 and Bruker DRX 400 instruments, equipped with a 5 mm multinuclear inverse detection z-gradient probe and a 5 mm direct detection z-gradient QNP probe, operating at 400.1 and 100.6 MHz for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ nuclei. For the benzimidazolium bromides derivatives, the chemical shifts are reported in d units (ppm), for ${ }^{1} \mathrm{H}$ relative to internal TMS and for ${ }^{13} \mathrm{C}$ relative to the residual peak of the solvent (ref.: $\mathrm{CHCl}_{3} 77.0 \mathrm{ppm}$ ). H,H-COSY,

H,C-HSQC and H,C-HMBC experiments, were recorded using standard pulse sequences in the version with z-gradients, as delivered by Bruker with TopSpin 1.3 PL10 spectrometer control and processing software. For the benzimidazolium bromides-cyclodextrins mixtures, the chemical shifts are reported in $\delta$ units (ppm), and were electronically referred to the residual peak of the solvent (ref.: $\mathrm{H}_{2} \mathrm{O} 4.8 \mathrm{ppm}$ ). The $\mathrm{H}, \mathrm{H}-$ ROESY experiments were recorded using standard pulse sequence, with water suppression, as delivered by Bruker with TopSpin 2.1 PL6 spectrometer control and processing software.

Synthesis of benzimidazolium bromides derivatives.
To a solution of 5 mmole of 1-benzil-5,6-dimethylbenzimidazoline in 30 mL acetone, 5 mmole of substituted phenacyl bromide was added. The reaction mixture was heated at reflux temperature for 3 h and left overnight at room temperature. The solid was filtered off, washed on the filter with 10 mL mixture of acetone-diethyl ether 1:1 and recrystallized from $\mathrm{MeOH} / \mathrm{Et}_{2} \mathrm{O}$.
